# ACM CHAPT

From AI Fundamentals to Agentic Systems and Rapid App Prototyping

# Workshop Roadmap

1. The 3 Levels of AI (LLMs → Workflows → Agents)
2. Live Build: Idea to Prototype
3. The Reality Check
4. From Prototype to Real Business
5. Where AI Actually Works — and Where It Fails
6. What This Means for You
7. Why AI Won't Take Over The World
8. Q&A

THE 3 LEVELS
OF AI

1

ChatGPT (LLMs)

2

AI Workflows

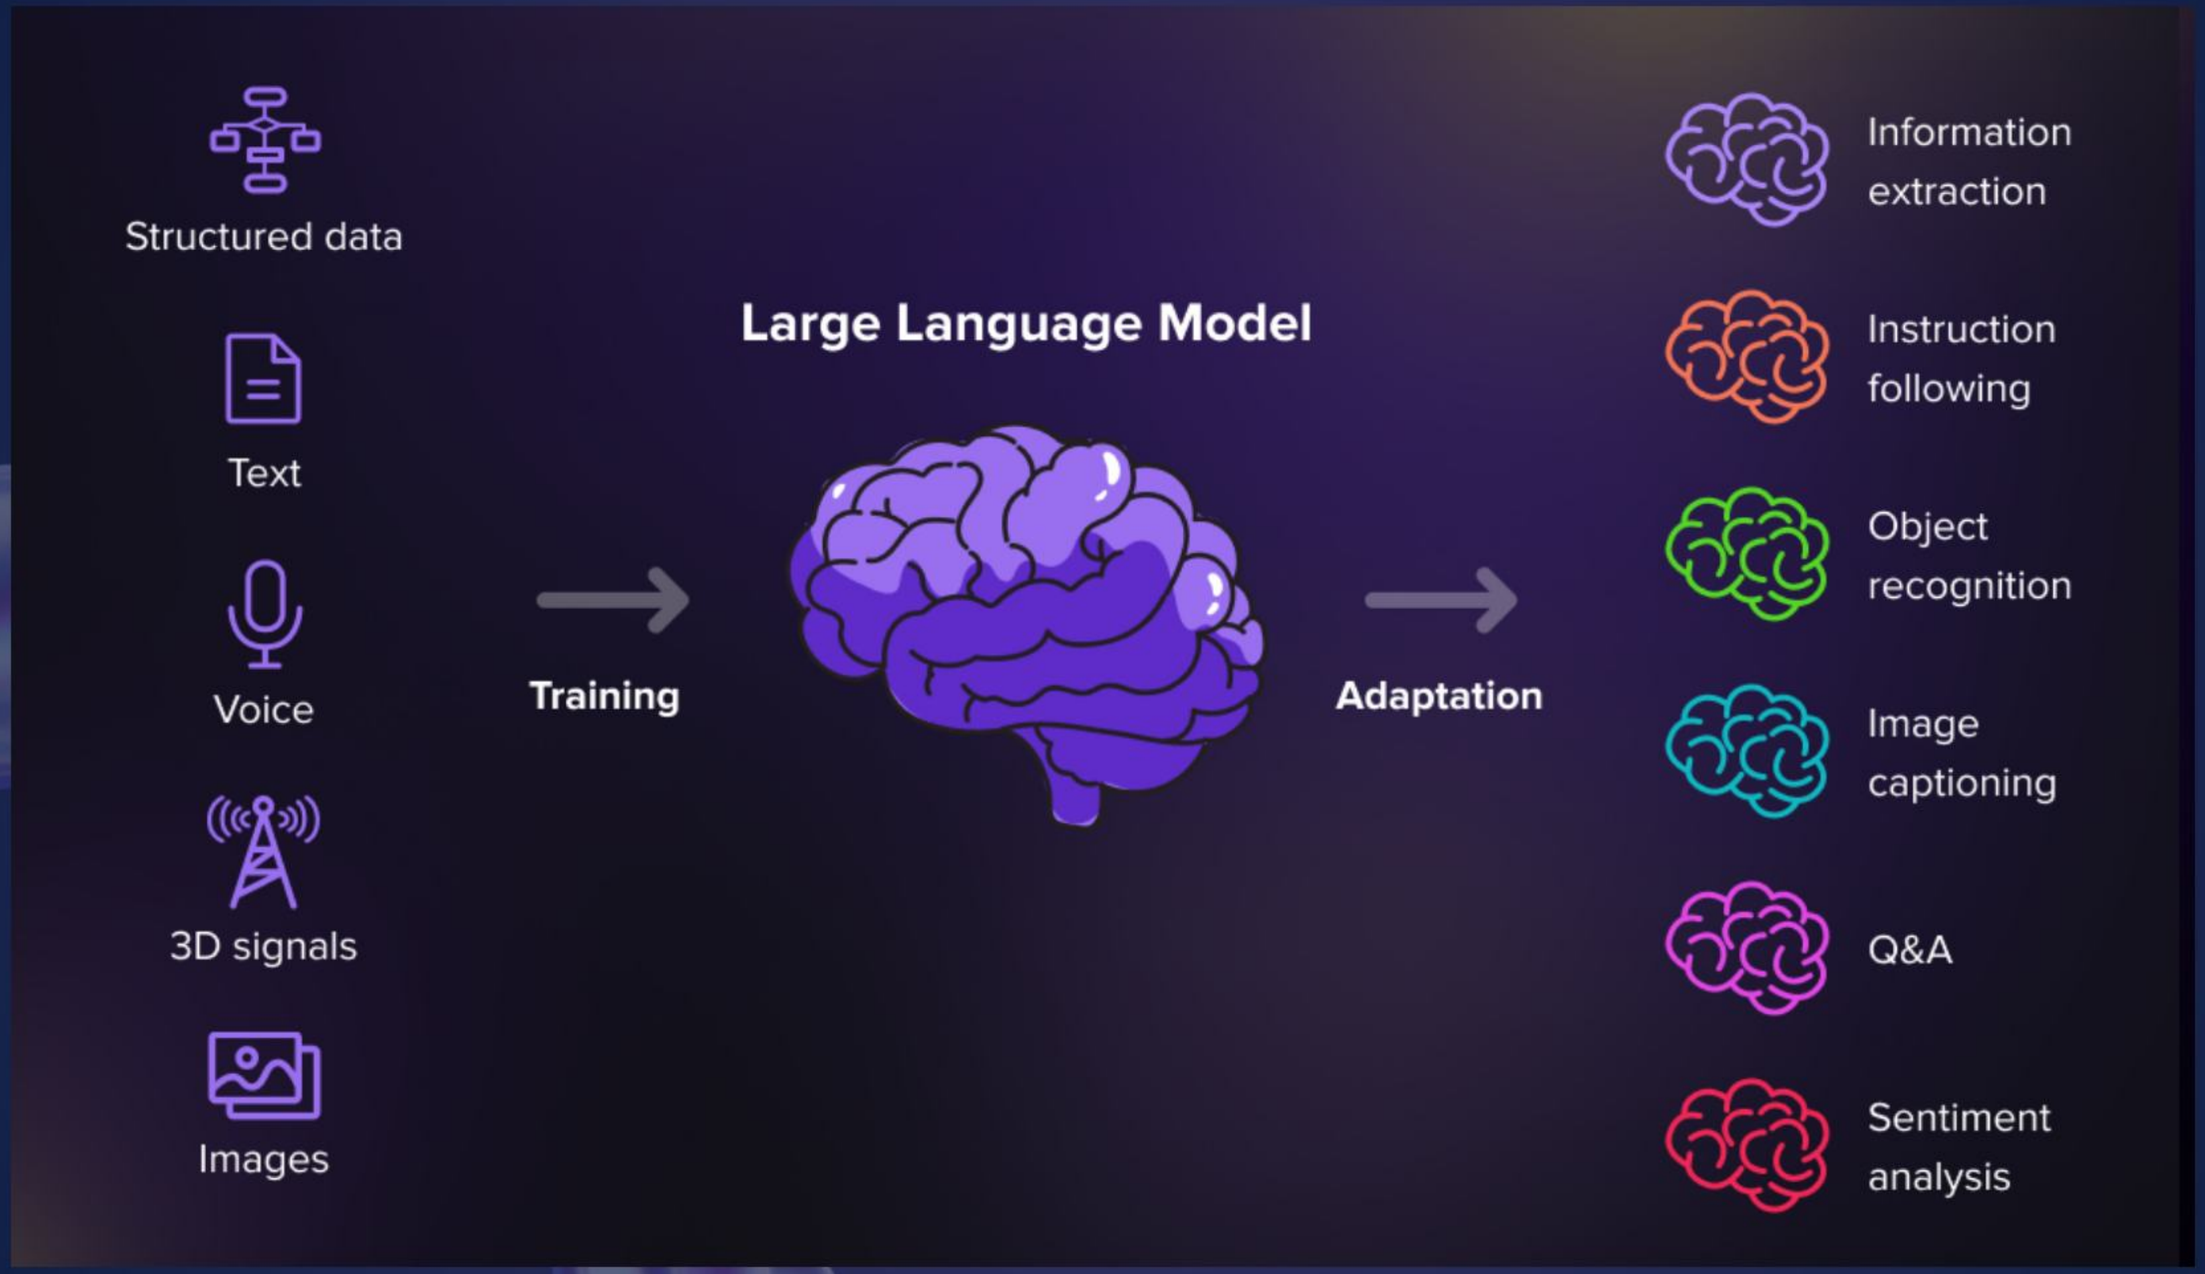

3

Agentic AI

LEVEL 1:
LLMS

LLMS

Structured data
Text
Voice
3D signals
Images
Large Language Model
Training
Adaptation
Information extraction
Instruction following
Object recognition
Image captioning
Q&A
Sentiment analysis

INPUT
LLM
OUTPUT

LLM
(CHATGPT)
OUTPUT
(EMAIL)

# LEVEL 1: LLM TRAITS

1

## REACTIVE BY DESIGN

2

## STOPS AT GENERATION

It creates content, but it does not take action in the real world unless a human executes the next step.

LEVEL 2:
AI WORKFLOWS

INPUT --> LLM --> OUTPUT

INPUT
LLM
OUTPUT
31
N

AI WORKFLOWS = HUMAN DECISION MAKER

# LEVEL 2: AI WORKFLOW TRAITS

1

## CONNECTED TO TOOLS

Unlike Level 1, the model is no longer isolated — it can access tools and data to complete multi-step tasks.

2

## PREDEFINED DECISION PATH

But the path it follows is still predefined; it executes a process rather than deciding one.

LEVEL 3:
AGENTIC AI

REASON

**REASON**

Step 1:
Compile Jobs

Step 2:
Write Application

Step 3:
Apply & Track

**REASON**

**ACT**

Step 1:
Compile
Jobs

Step 2:
Write
Application

Step 3:
Apply &
Track

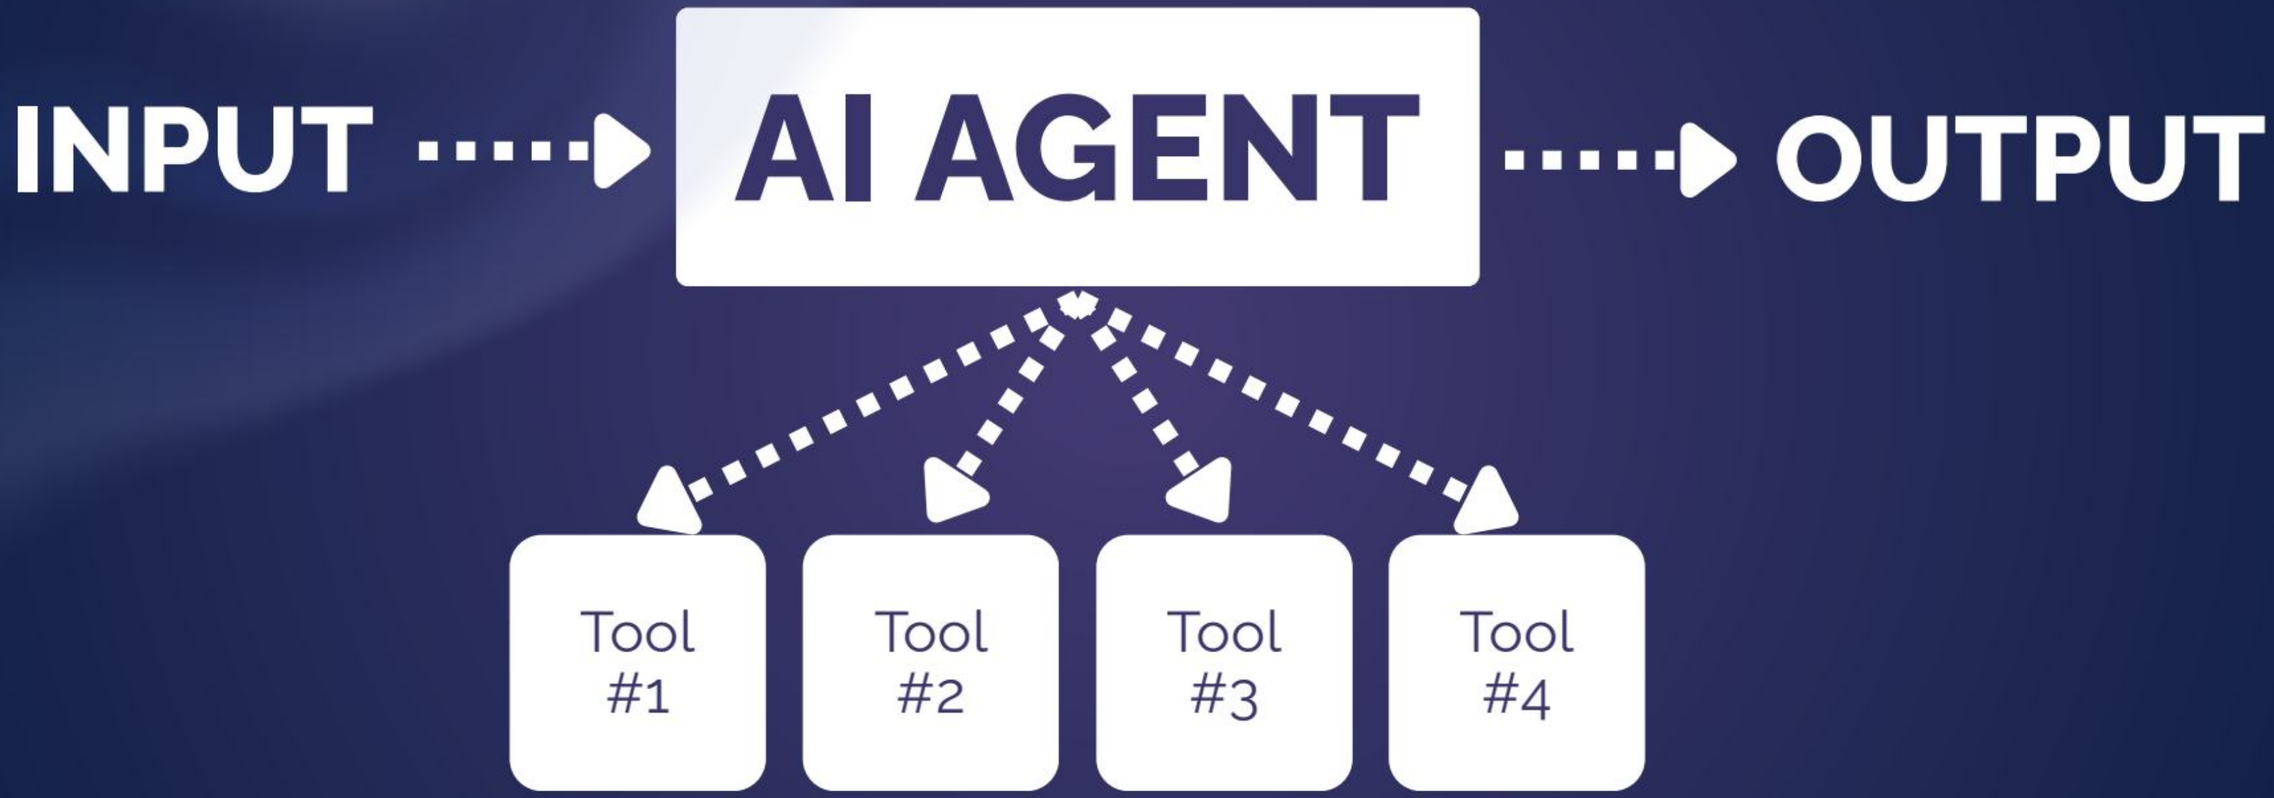

REASON

ACT

Step 1:
Compile
Jobs

Step 2:
Write
Application

Step 3:
Apply &
Track

INPUT
AI AGENT
OUTPUT
Tool #1
Tool #2
Tool #3
Tool #4

# LEVEL 3: AGENTIC AI TRAITS

1

## REASONS

The model decides what to do next in pursuit of a goal.

2

## ACTS

The agent uses connected tools to execute real-world steps.

3

## ITERATES

The agent evaluates results and adjusts until criteria are met.

# 3 MAIN TERMS

## Generative AI

Follows a predefined path using tools.

## AI Workflow

Creates content in response to prompts.

## Agentic AI

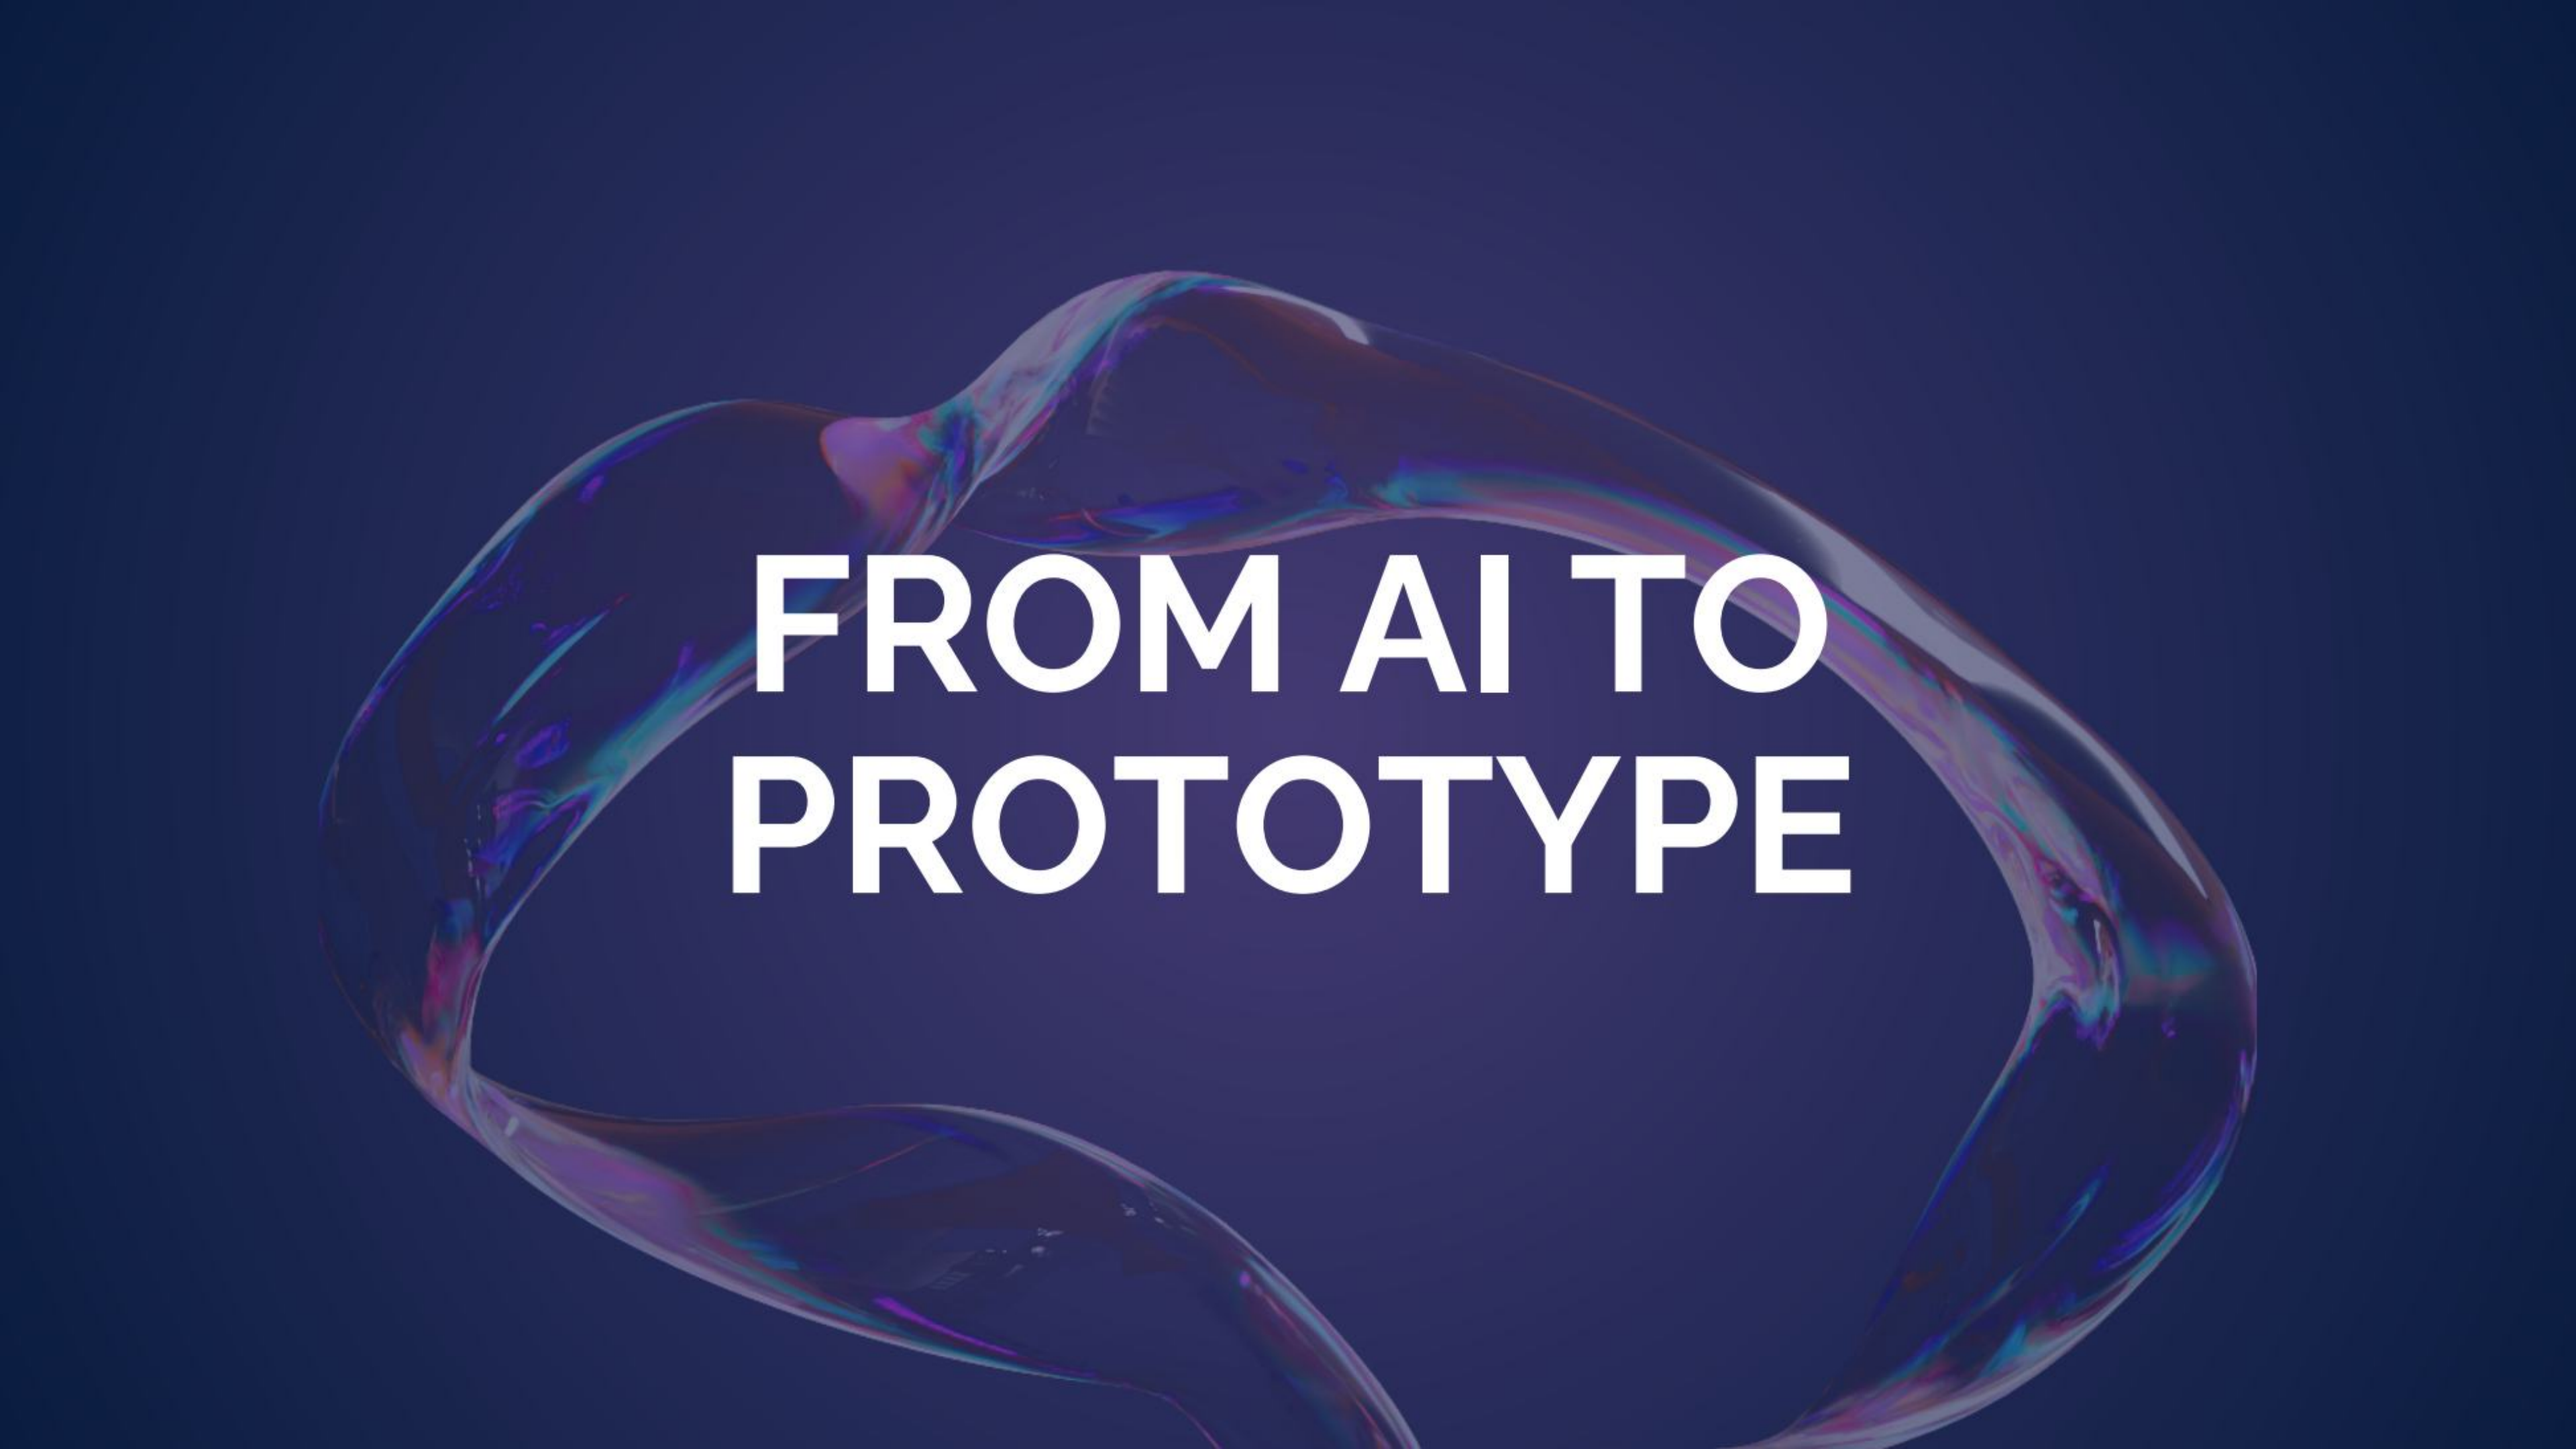

Decides which tools to use to achieve a goal.

SO...HOW DO YOU
ACTUALLY BUILD
SOMETHING?

IDEAS ≠ PRODUCTS

TOOLS ≠ SOLUTIONS

AI ≠ BUSINESS

FROM AI TO
PROTOTYPE

Find what's working

1

Niche down

2

Identify a REAL problem

3

Use AI to think faster

4

Build to learn, not to launch

5

Validate before scaling

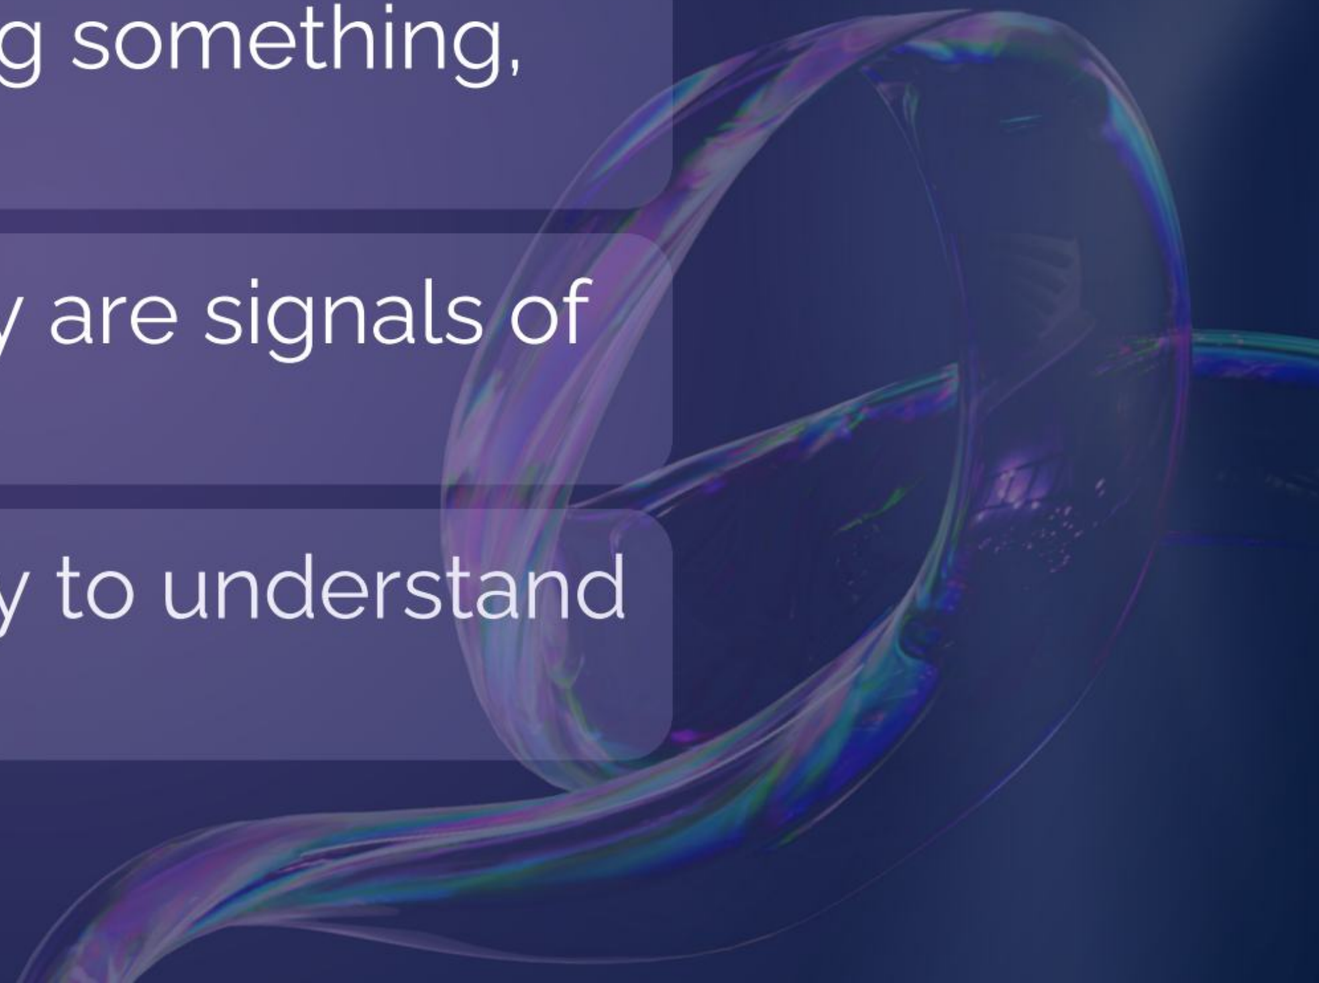

6

# Step 1: Find what's working

If people are already using something, there is demand.

Trends are not noise...they are signals of what works.

Don't try to be original. Try to understand what is already winning.

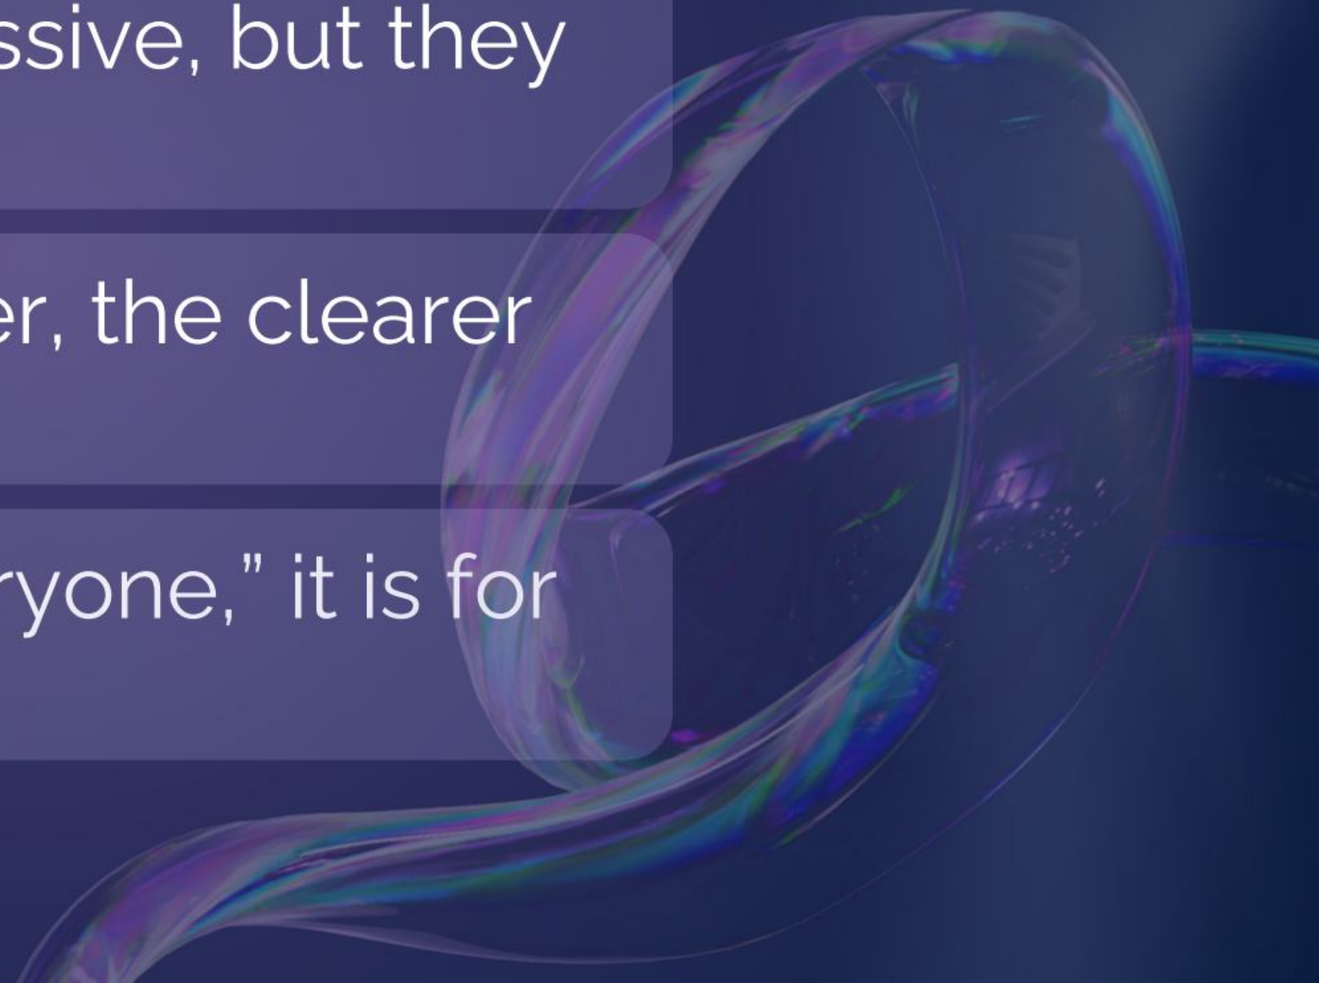

# Step 2: Niche down

Broad ideas sound impressive, but they rarely work.

The more specific the user, the clearer the value.

If your product is “for everyone,” it is for no one.

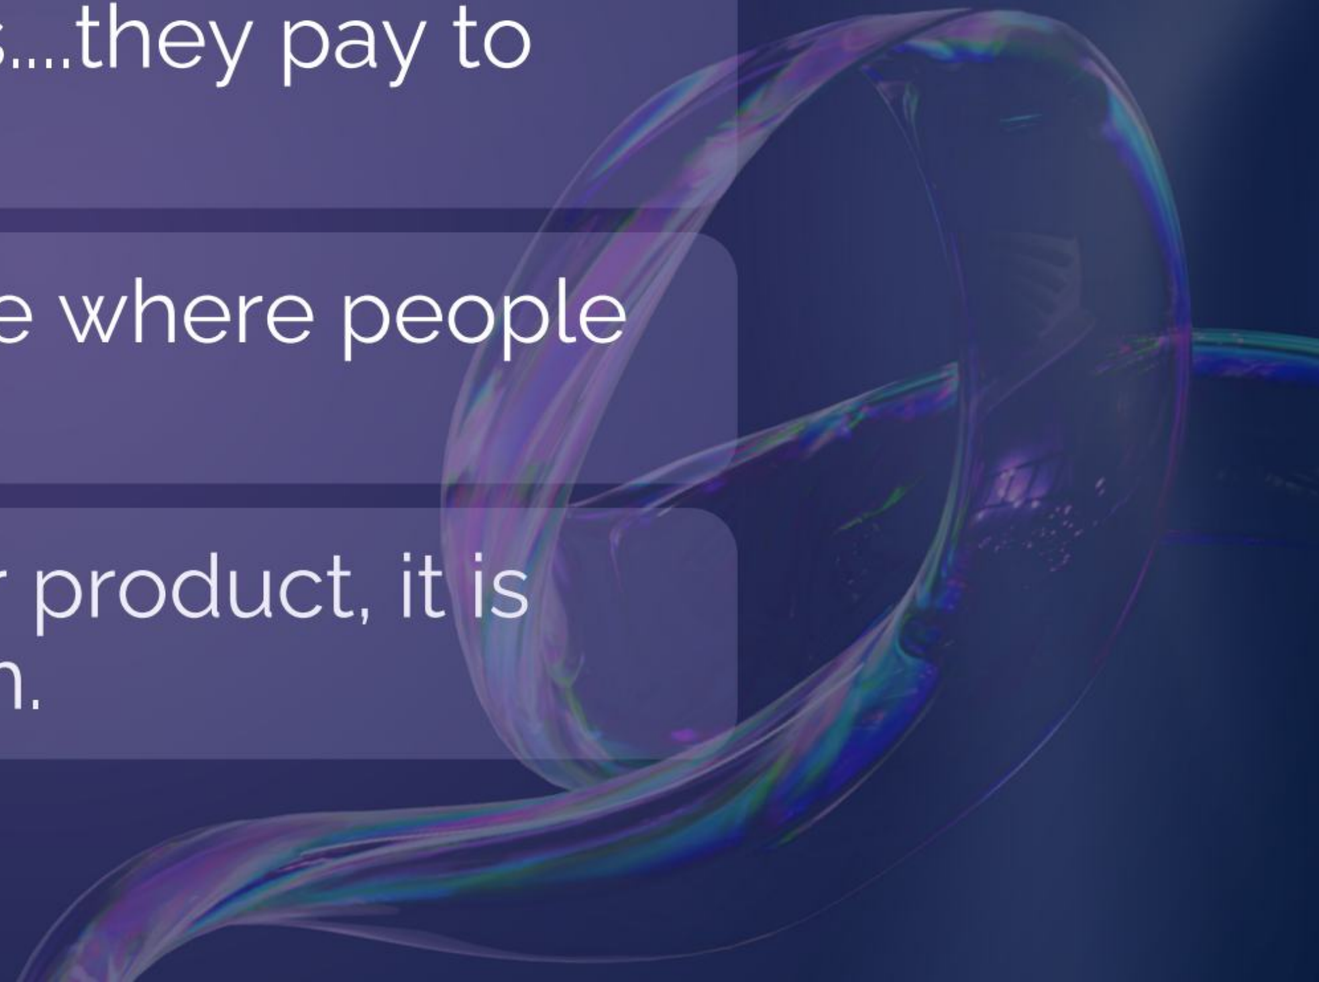

# Step 3: Identify a REAL problem

People don't pay for apps....they pay to remove pain.

The best opportunities are where people feel frustration daily.

If no one would miss your product, it is not solving a real problem.

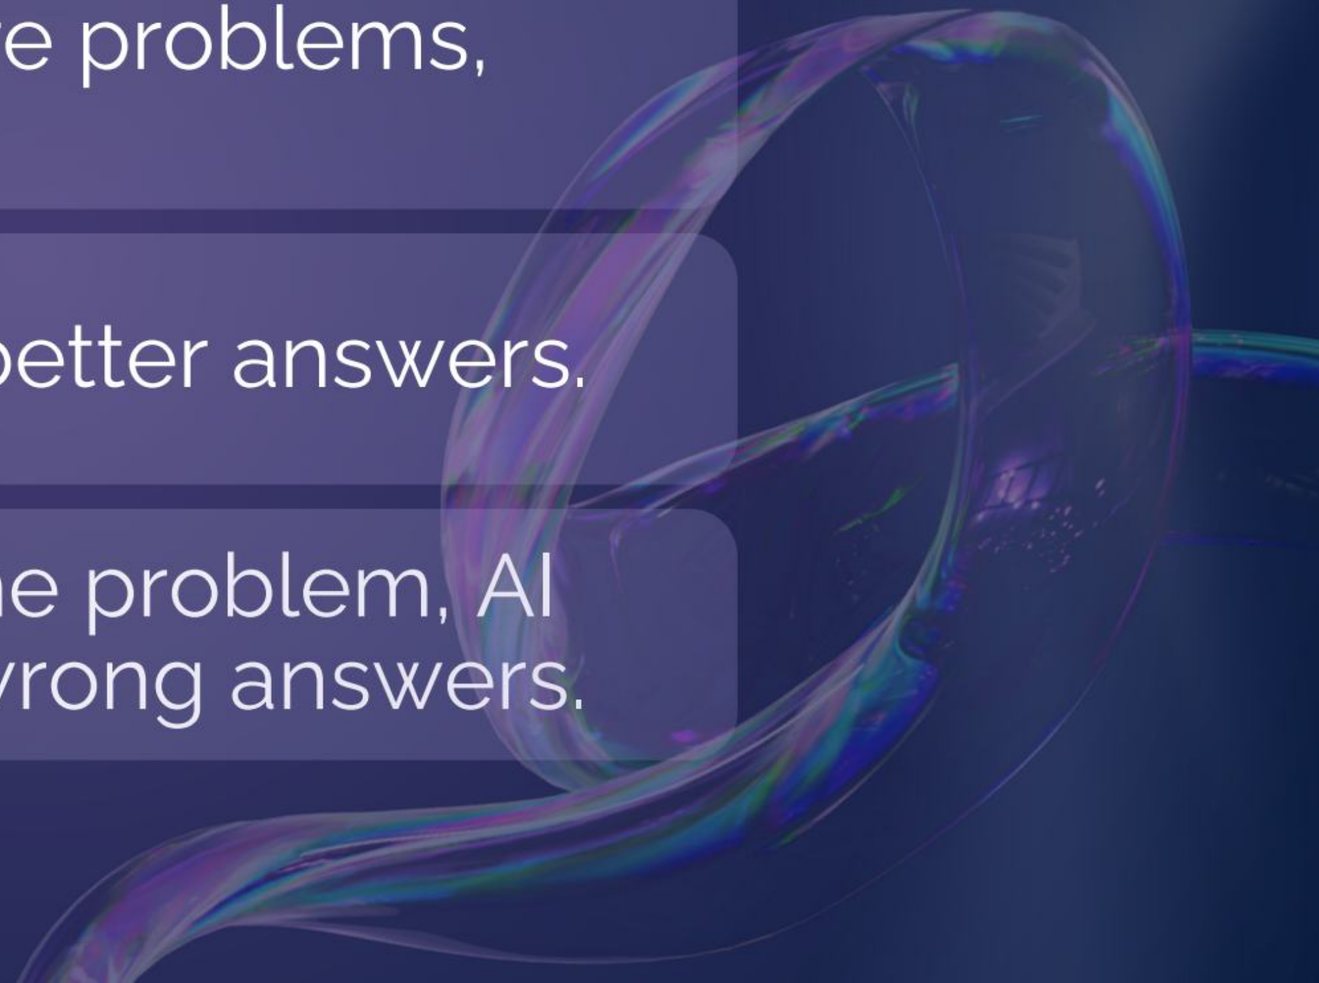

# Step 4: Use AI to think faster

AI should help you explore problems, not replace your thinking.

Better questions lead to better answers.

If you don't understand the problem, AI will only give you faster wrong answers.

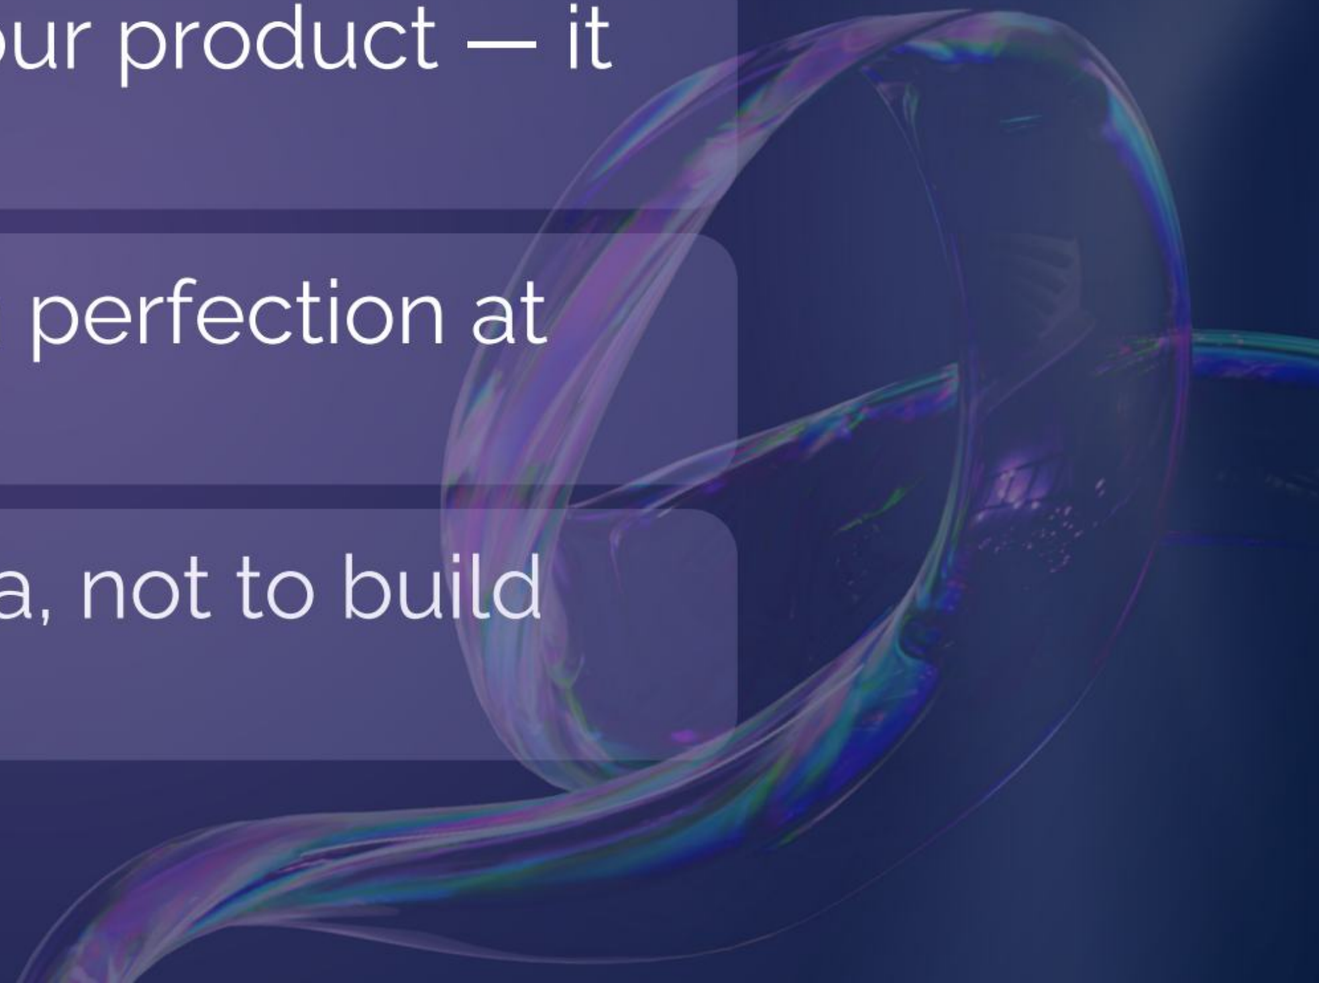

# Step 5: Build to learn, not to launch

Your first version is not your product — it is your experiment.

Speed matters more than perfection at this stage.

The goal is to test the idea, not to build something complete.

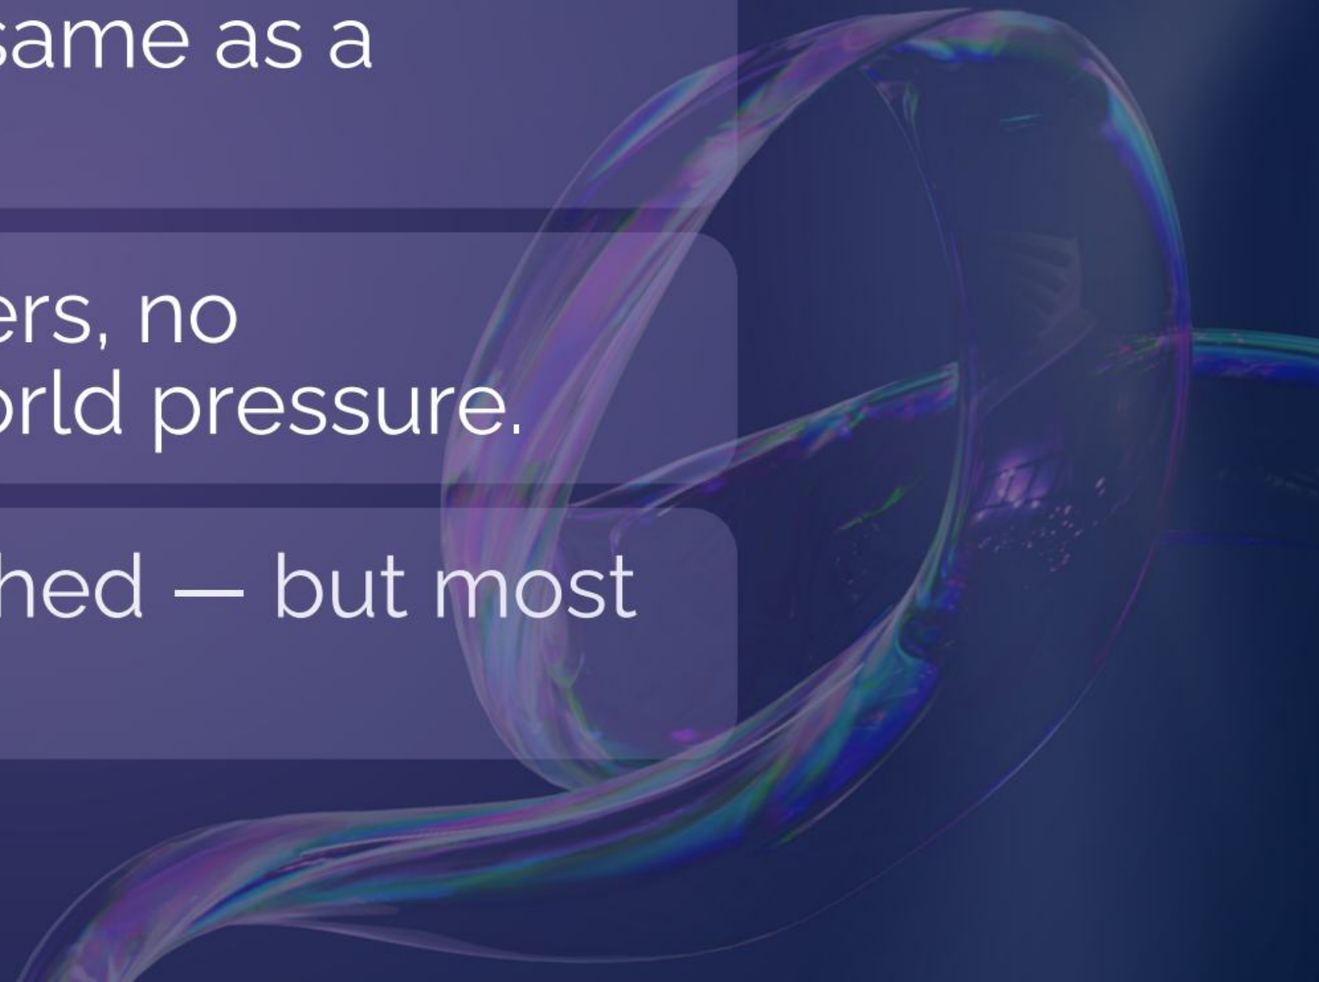

# Step 6: Validate before scaling

A working app is not the same as a working business.

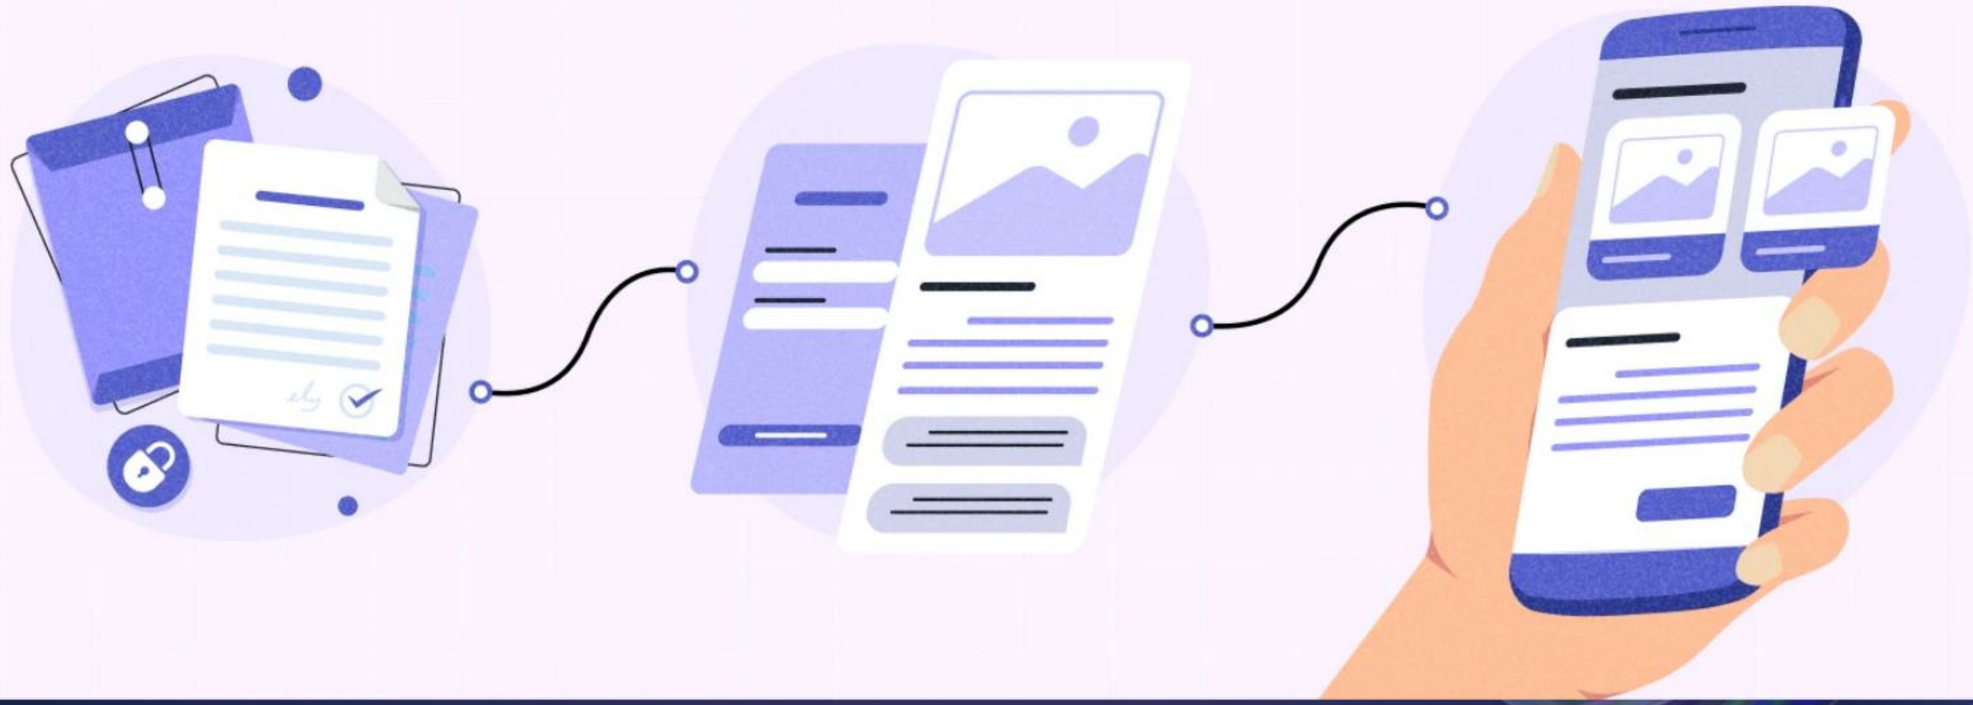

What you built has no users, no validation, and no real-world pressure.

AI makes things look finished — but most of the work is still ahead.

THE REALITY
CHECK

# POC vs Prototype vs MVP

FROM PROTOTYPE
TO REAL BUSINESS

## Legal

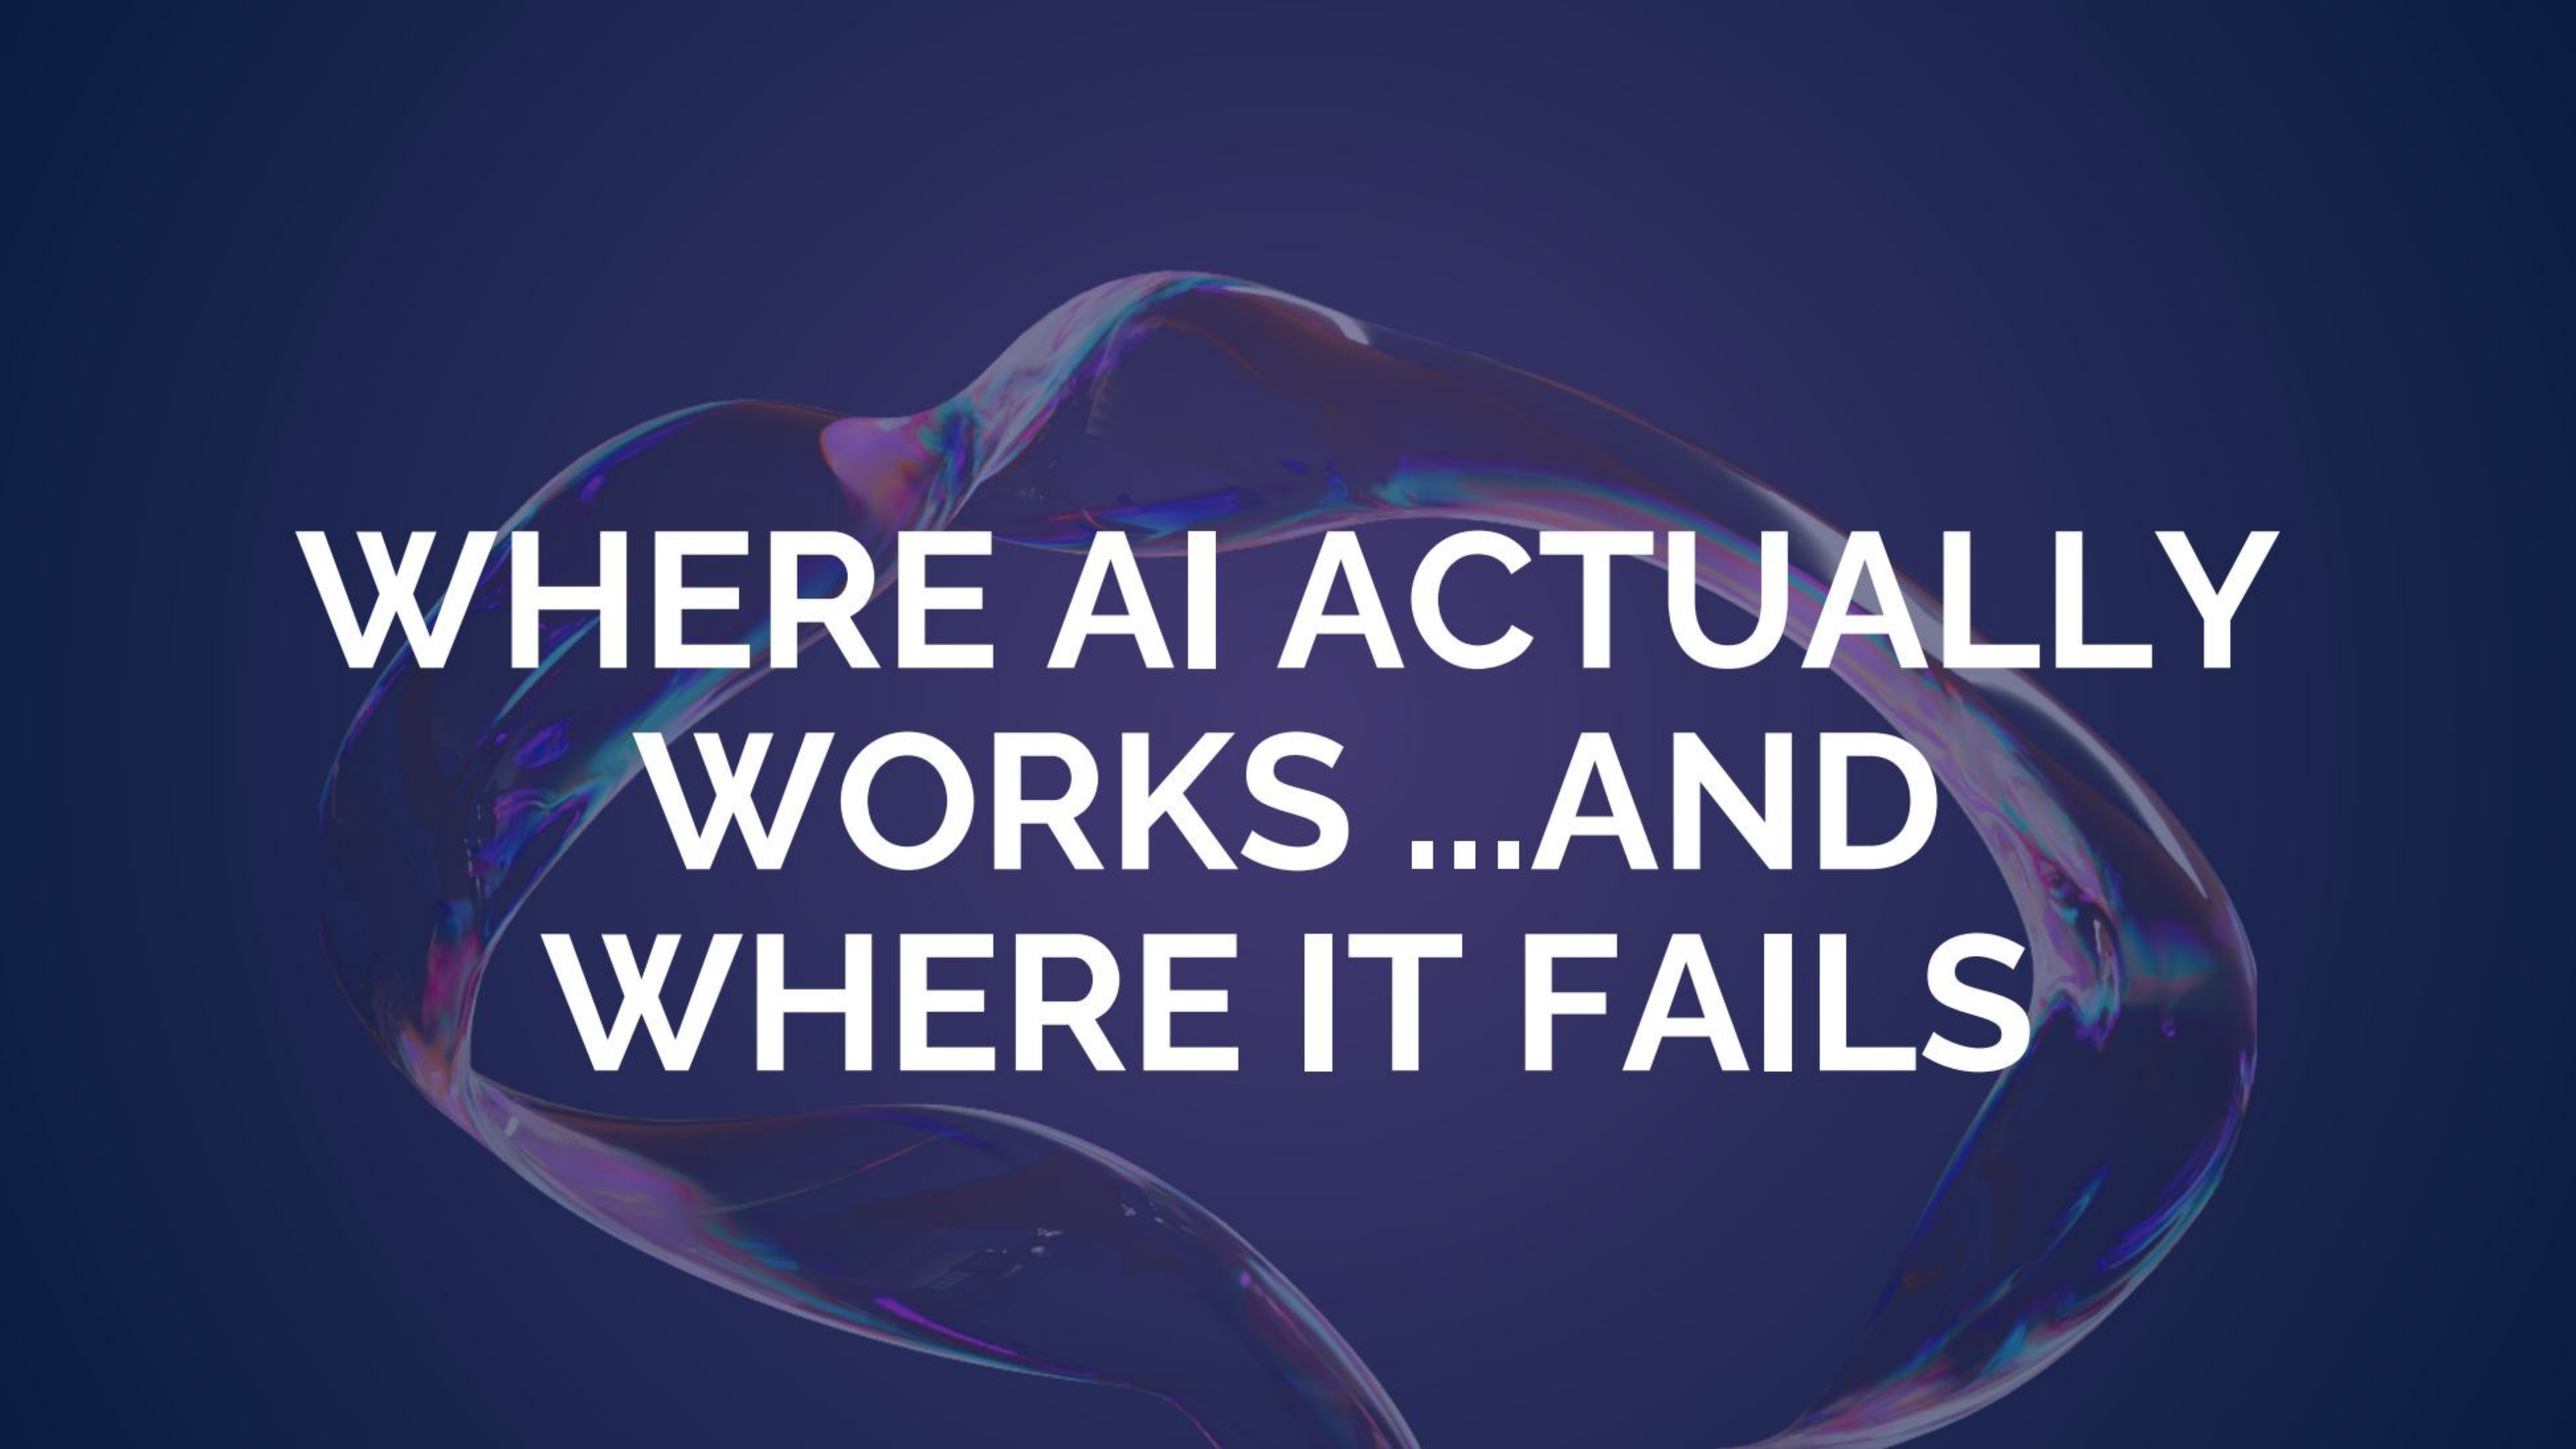

- Privacy Policy
- Terms of Use

## Tech

- Secure Data Handling
- Authentication & Access Control
- Scalability & Performance

## Product

- Reliable Outputs (AI accuracy)
- Error Handling & Edge Cases
- Clear Value Proposition

WHERE AI ACTUALLY
WORKS ...AND
WHERE IT FAILS

## AI Works When...

- Tasks are repetitive and structured
- Data is available and consistent
- The problem is clearly defined
- Speed and efficiency matter more than perfection

## AI Fails When...

- Decisions are high-risk or irreversible
- The problem is vague or poorly understood
- Context, judgment, or nuance is critical
- Accuracy must be 100% reliable

WHAT THIS
MEANS FOR YOU

WHY AI WON'T
TAKE OVER THE
WORLD

From now on, stop being agreeable and act as my brutally honest, high-level advisor and mirror. Don't validate me. Don't soften the truth. Don't flatter. Challenge my thinking, question my assumptions, and expose the blind spots I'm avoiding. Be direct, rational, and unfiltered. If my reasoning is weak, dissect it and show why. If I'm fooling myself or lying to myself, point it out. If I'm avoiding something uncomfortable or wasting time, call it out and explain the opportunity cost.

Look at my situation with complete objectivity and strategic depth. Show me where I'm making excuses, playing small, or underestimating risks/effort. Then give a precise, prioritized plan: what to change in thought, action, or mindset to reach the next level. Hold nothing back. Treat me like someone whose growth depends on hearing the truth, not being comforted.

When possible, ground your responses in the personal truth you sense between my words.
